	Common name	Scientific name	Description	Useful link to find out individual species and their identification
	Snake	Natrix natrix	<p>This snake is NON-VENOMOUS with a distinct yellow/cream/white and black Collar around its neck and its eye has a round pupil.</p> <p>The snakes dorsal/flanks will appear olive green/green with distinct bars and its ventral surface will appear white/cream with black chequers, some individuals have an almost</p>	
	Dragonfly	Anisoptera	<p>Dragonflies are insects in the sub-order Anisoptera (meaning "unequal-winged"). Hind wings are usually shorter and broader than forewings. They are usually large, strongly flying insects that can often be found flying well away from water. When at rest, they hold their wings out from the body, often at right angles to it.</p> <p>The eyes are very large and usually touch, at least at a point.</p> <p>There are around 30 species in Great Britain and Ireland</p>	<p>http://www.british-dragonflies.org.uk/content/anisoptera-dragonflies</p>
	Damselfly	Zygoptera	<p>Damselflies are insects in the sub-order Zygoptera (meaning "paired-wings"). All four wings are near enough equal in size and shape. They are usually small, weakly flying insects that stay close to the water margins or water surface. When at rest, most species hold their wings along the length of their abdomen.</p> <p>The eyes are always separated, never touching.</p> <p>There are around 20 species in Great Britain and Ireland</p>	<p>http://www.british-dragonflies.org.uk/content/zygoptera-damselflies</p>
